

Walk-through 001

BASIC PROJECT SETUP

- Create a new **EMPTY** project in your IDE and call it 'RealTimeWebAppsWithNodeJS'. Within this project we'll store along the course different example apps that will be run separately.
- In the project, create a new **WEB** module (intellij IDEA) / a new folder (WebStorm). Call it '00_helloNode'.
- Open Terminal window within the IDE (Alt + F12) and cd to your module / folder.
- Type: **npm init** then hit enter.
- Go through npm wizard to create a package.json file. (specify app.js as the main JS)
- Create **app.js** file in your module folder and open it in the editor.
- Type **console.log ('hello node');** and save.
- In terminal cd to this example app folder, type **node app** and hit enter. You will see the 'hello node' being printed in the server console.
